## □ Names of Notions Nominate Notation

- the initial letters of names of objects often provide good efficient suggestive easy-to-remember literal notation for the notions under consideration; that general notational principle is illustrated in several ways in the following

□ first letters are good symbols

it has long been generally recognized that taking the first letter (lowercase or capital) of the name of a mathematical object (individual or species), or first letter of the principal word in a name phrase, as a symbol/sign (constant or variable) for this object is often sound notational practice

eg

- $a$  = angle
- $A$  = algebra
- $A_n$  = the alternating group on  $n$  objects
- $A$  = angle
- $A$  = area

- $b$  = base length
- $B_n$  or  $B^n$  =  $n$ -ball
- $B$  = Banach space
- $B$  = base area
- $B(n)$  = the  $n$ th Bell number
- $B_n$  = the  $n$ th Bernoulli number
- $B_r$  = the bounding  $r$ -cycle group
- $B^r$  = the cobounding  $r$ -cocycle group

- $c$  = cardinal of the continuum
- $c$  = constant
- $C_r$  = the r-chain group
- $C^r$  = the r-cochain group
- $C$  = circumference
- ${}_n C_r$  = the number of combinations of n things taken r at a time
- $C$  = complex
- $C$  = constant
- $C$  = curve
- $d$  = diameter
- $d$  = difference
- $d$  = differential/derivative
- $D$  = derivative
- $D$  = discriminant
- $D$  = domain

- $e$  = eccentricity
- $e$  = base of exponential function
- $E$  = entropy
- $f_n$  = the  $n$ th Fibonacci number
- $f$  = function
- $F$  = truth-value falsity
- $F_n$  = the  $n$ th Fermat number
- $F$  = field
- $F$  = function

- $g$  = genus
- $G$  = group
- $h$  = height
- $h$  = homeomorphism
- $H$  = Hamiltonian (from Hamilton)
- $H_p$  or  $H^p$  = the Hardy space of index  $p$
- $H$  = Hessian (from Hesse)
- $H_n$  = the  $n$ th harmonic number
- $H$  = Hilbert space
- $H_r$  = the  $r$ -homology group
- $H^r$  = the  $r$ -cohomology group

- $i$  = imaginary unit
- $i$  = index
- $I$  = identity matrix
- $I$  = indicator
- $I$  = integral
- $I$  = interval
- $J$  = Jacobian (from Jacobi)
- $k$  = constant (phonetic value)
- $K$  = complex (phonetic value)
- $K$  = knot

- $l_p$  or  $l^p$  = the Lebesgue sequence space of index  $p$   
(note the script lowercase  $l$ )
- $L$  = Lagrangian (from Lagrange)
- $L_p$  or  $L^p$  = the Lebesgue function space of index  $p$
- $L$  = length
- $m$  = mean
- $m$  = measure
- $m$  = modulus
- $m$  = moment
- $M$  = Turing machine
- $M$  = manifold
- $M$  = matrix
- $M_n$  = the  $n$ th Mersenne number
- $M$  = module
- $M$  = monoid

- $n$  = number
- $N$  = norm
- $N$  = number
- $O$  = origin
- $p$  = prime number
- $p$  = proposition
- ${}_n P_r$  = the number of permutations of  $n$  things taken  $r$  at a time
- $P$  = point
- $P$  = polynomial
- $q$  = quaternion
- $Q$  = quadrant

- $r$  = radial distance
- $r$  = radian
- $r$  = radius
- $r$  = ratio
- $R$  = range
- $R$  = region
- $R$  = relation
- $s$  = semiperimeter
- $s$  = side
- $s$  = subtending arc
- $S$  = space
- $S^n$  =  $n$ -sphere
- $S$  = surface
- $S$  = surface area

- $t$  = time
- $T$  = tensor
- $T$  = transformation
- $T$  = truth-value truth
- $\mathbf{u}$  = unit vector  
(note the boldface lowercase  $u$ )
- $v$  = velocity
- $V$  = Vandermonde determinant
- $V$  = variation
- $V$  = vector space
- $V$  = volume
- $w$  = weight
- $w$  = width
- $W$  = Wronskian (from Wronski)

□ basic notation for sets / systems of numbers;  
this notation uses  
capital English letters in the open - face style;  
this notation is now more - or - less  
universally adopted in denoting  
the main line of number systems  
viz

$$\mathbb{P} \subset \mathbb{N} \subset \mathbb{Z} \subset \mathbb{Q} \subset \mathbb{R} \subset \mathbb{C} \subset \mathbb{H} \subset \mathbb{O}$$

- $\mathbb{P}$  = the set of all positive integers  
= the set of positive integers  
= the positive integer set  
= the positive integers  
= the semiring of positive integers
  
- $\mathbb{N}$  = the set of all nonnegative integers  
= the set of nonnegative integers  
= the nonnegative integer set  
= the nonnegative integers  
= the semiring of nonnegative integers

•  $\mathbb{Z}$  = the set of all integers

= the set of integers

= the integer set

= the integers

= the ring of integers

•  $\mathbb{Q}$  = the set of all rational numbers

= the set of rational numbers

= the rational number set

= the rational numbers

= the set of all rationals

= the set of rationals

= the rationals

= the field of rational numbers

- $\mathbb{R}$  = the set of all real numbers
- = the set of real numbers
- = the real number set
- = the real numbers
- = the set of all reals
- = the set of reals
- = the reals
- = the field of real numbers
- = the field of reals

- $\mathbb{C}$  = the set of all complex numbers
- = the set of complex numbers
- = the complex number set
- = the complex numbers
- = the field of complex numbers

- $\mathbb{H}$  = the set of all quaternions
- = the set of quaternions
- = the quaternion set
- = the quaternions
- = the division ring of quaternions

- $\mathbb{O}$  = the set of all octonions
- = the set of octonions
- = the octonion set
- = the octonions
- = the nonassociative noncommutative real linear algebra of octonions

- origin of notation

$\mathbb{P} \leftarrow$  positive

$\mathbb{N} \leftarrow$  nonnegative, natural, number

$\mathbb{Z} \leftarrow$  die Zahl (German) = number

$\mathbb{Q} \leftarrow$  quotient

$\mathbb{R} \leftarrow$  real

$\mathbb{C} \leftarrow$  complex

$\mathbb{H} \leftarrow$  Hamilton = discoverer / inventor of quaternions

$\mathbb{O} \leftarrow$  octonion

□ the field of all complex algebraic numbers

= the field of complex algebraic numbers

= the complex algebraic number field

=<sub>dn</sub>  $\mathbb{A}$

=<sub>rd</sub> (open cap) ay

wh

$\mathbb{A} \leftarrow$  the initial letter of 'algebraic'

□ the field of all real algebraic numbers

= the field of real algebraic numbers

= the real algebraic number field

=  $\mathbb{A} \cap \mathbb{R}$

=<sub>dn</sub>  $\mathbb{A}_r$

wh

$\mathbb{A}_r \leftarrow \mathbb{A}$  and the initial letter of 'real'

□ the ring of all Gaussian integers

= the ring of Gaussian integers

= the Gaussian integer ring

=<sub>df</sub>  $\{m + in \mid m, n \in \mathbb{Z}\}$

=  $\mathbb{Z} + i\mathbb{Z}$

=<sub>dn</sub>  $\mathbb{G}$

=<sub>rd</sub> (open cap) gee

wh

$\mathbb{G} \leftarrow$  the initial letter of 'Gauss'

□ the field with exactly  $p^n$  elements

wh  $p \in \text{prime}$  &  $n \in \text{pos int}$

= the field with  $p^n$  elements

= the field of order  $p^n$

=<sub>dn</sub>  $\mathbb{F}(p^n)$

=<sub>rd</sub> (open cap) ef of  $p^n$

wh

$\mathbb{F} \leftarrow$  the common initial letter of 'finite field'

note:

a field with only finitely many elements

= a field with exactly a prime power  $p^n$

of elements

= a finite field

= a Galois field

□ euclidean space of dimension  $n$

wh  $n \in \text{nonneg int}$

=  $n$  - dimensional euclidean space

= euclidean  $n$  - space

=<sub>dn</sub>  $\mathbb{E}^n$

=<sub>rd</sub> (open cap) ee (super)  $n$

wh

$\mathbb{E}$  ← the initial letter of 'euclidean' (from Euclid)

□ projective space of dimension  $n$   
wh  $n \in \text{nonneg int}$   
=  $n$  - dimensional projective space  
= projective  $n$  - space  
=  $\mathbb{P}^n$   
=  $\mathbb{P}^n$  (open cap) pe (super)  $n$   
wh  
 $\mathbb{P} \leftarrow$  the initial letter of 'projective'

□ the unit circle

= the circle group

=<sub>dn</sub>  $\mathbb{T}$

=<sub>rd</sub> (open cap) tee

wh

$\mathbb{T}$  ← the initial letter of 'torus'

the circle being the 1 - torus

□ the n - dimensional torus

wh  $n \in \text{nonneg int}$

= the n - torus

= the n - toral group

=<sub>dn</sub>  $\mathbb{T}^n$

=<sub>rd</sub> (open cap) tee (super) n

wh

$\mathbb{T}$  ← the initial letter of 'torus'

□ sometimes  
initial letters of words  
from other languages  
make notational contributions;  
here are four examples from German:

- $e$  = unit  
from the German word  
die Einheit = unit/unity
- $U$  = neighborhood  
from the German word  
die Umgebung = neighborhood
- $Z_r$  = the  $r$ -cycle group  
&  $Z^r$  = the  $r$ -cocycle group  
from the German word  
der Zyklus = cycle
- $\mathbb{Z}$  = the set of integers  
from the German word  
die Zahl = number

□ sometimes  
the corresponding letter in Greek  
is used for the notation  
instead of  
the first letter of the English name;  
the original word  
may have itself been in Latin or Greek  
eg

- $\alpha$  = angle
- $\varepsilon$  = initial letter of the Greek word  $\varepsilon\sigma\tau\iota$   
(see the Latin *est* = is inside?)  
meaning 'is' and used to stand for  
'is an element of'
- $\kappa$  = curvature
- $\lambda$  = Lagrange multiplier
- $\mu$  = mean
- $\pi$  = periphery = circumference  
(of a circle with unit diameter)
- $\pi(x)$  = prime-counting function

- $\rho$  = radius of curvature
- $\sigma$  = simplex
- $\tau$  = torsion
- $\varphi$  = function
- $\phi$  = denotation of the golden ratio;  
so chosen in honor of  
Phidias ( $\Phi$ ειδίας) of Athens  
fl ca 490-430 BCE  
Greek  
greatest sculptor of ancient Greece;  
supervised construction of Parthenon
- $\chi$  = characteristic
- $\Delta$  = difference
- $\Delta$  = discriminant
- $\Pi$  = product/production
- $\Sigma$  = sum/summation
- $\Phi$  = function

□ apparently  
for some functions  
the letter denotation came first  
and the name came from the letter  
eg

- the Kronecker delta =  $\delta_{ij}$  eg
- the Dirac delta function =  $\delta(x)$
- the Riemann zeta function =  $\zeta(z)$
- the Möbius mu function =  $\mu(n)$
- the Euler phi function =  $\varphi(n)$
- the Euler beta function =  $B(x, y)$
- the Euler gamma function =  $\Gamma(x)$

□ notation for Borel sets & their classes

Δ letters for the classes of closed sets & open sets  
in a topological space

- F = the class of closed sets  
which comes from  
the initial letter of the French word  
fermé = closed
- G = the class of open sets  
which comes from  
the initial letter of the German word  
das Gebiet = region

$\Delta$  letters for set-theoretic operators on classes of sets

- $\sigma$  = the countable union operator for a class of sets which is the lowercase form of the Greek letter sigma  $\Sigma \sigma$

which is suggested by the initial letter of the following words

sum (English)

= la somme (French)

= die Summe (German)

= summa (Latin)

since ess & sigma correspond in sound & transliteration

- $\delta$  = the countable intersection operator for a class of sets which is the lowercase form of the Greek letter delta  $\Delta \delta$

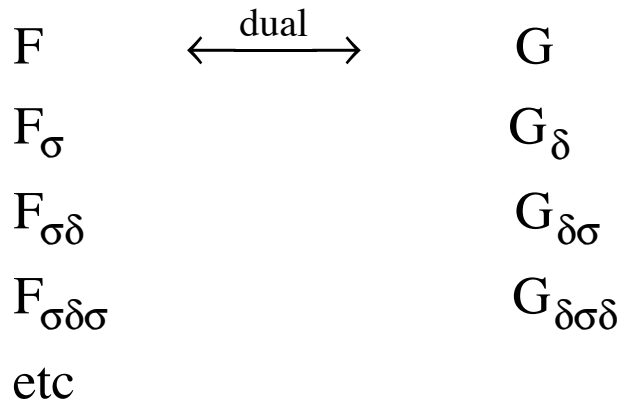

which is suggested by the initial letter of the German word

der Durchschnitt = intersection

since dee & delta correspond

in sound & transliteration

$\Delta$  the classes of Borel sets of index  $< \omega$

wh

these symbols are read as follows:

F = ef

$F_\sigma$  = ef sigma

$F_{\sigma\delta}$  = ef sigma delta

etc

G = gee

$G_\delta$  = gee delta

$G_{\delta\sigma}$  = gee delta sigma

etc

□ to write a bold-face lowercase or capital letter, underline

eg

• boldface a = **a** = a

• boldface A = **A** = A

note: letters denoting vectors & matrices are often printed in boldface type

□ capital script letters are sometimes useful;  
here are a few examples

- script B =  $\mathcal{B}$  = filter-base
- script C =  $\mathcal{C}$  = Cauchy filter/filter-base
- script C =  $\mathcal{C}$  = cluster = class of sets
- script F =  $\mathcal{F}$  = filter
- script I =  $\mathcal{I}$  = (coefficient of) imaginary part of
- script N =  $\mathcal{N}$  = neighborhood filter
- script P =  $\mathcal{P}$  = power set of
- script R =  $\mathcal{R}$  = real part of
- script T =  $\mathcal{T}$  = topology

note: cap script 'letter'  
may be used to denote  
the system whose base is denoted by  
cap Roman 'letter'

□ typographically ambiguous letters

△ the three English letter forms of

lowercase el = l

capital oh = O

lowercase oh = o

are typo-ambiguous in that

the first letter resembles

the numeral one = 1

&

the second two letters resemble

the numeral zero = 0

& a pictograph for a circle

which is a circle;

thus their use requires caution

- if lowercase el is to be suggestively used for 'length' say, it is to be recommended that the script lowercase el be used to distinguish it from the numeral one = 1

- the use of cap oh O  
for the origin of a coordinate system  
is congenial  
because  
oh is the initial letter of 'origin'  
and all the coordinates of the origin are  
zero

- the use of cap oh O  
for a general operation  
with prefix notation  
is congenial;  
observe  
 $O(x)$   
 $O(x, y)$   
 $O(x, y, z)$   
etc  
wh O is from the initial letter of 'operation'

- the use of lowercase oh o (suspended)  
for a general binary operation  
with infix notation  
is congenial;  
observe  
 $x o y$   
wh o is the initial letter of 'operation'

Δ there is typo-ambiguity  
between thirteen capital letters  
of the Greek alphabet  
and capital letters  
of the English /Latin alphabet  
viz

- A = cap Greek alpha = cap English ay
- B = cap Greek beta = cap English bee
- E = cap Greek epsilon = cap English ee
- Z = cap Greek zeta = cap English zee
- H = cap Greek eta = cap English aitch
- I = cap Greek iota = cap English eye
- K = cap Greek kappa = cap English kay
- M = cap Greek mu = cap English em
- N = cap Greek nu = cap English en
- O = cap Greek omicron = cap English oh
- P = cap Greek rho = cap English pe
- T = cap Greek tau = cap English tee
- X = cap Greek chi = cap English ex

Δ there is also typo-ambiguity  
with four lowercase letters:

- lowercase Greek kappa κ  
is similar to  
but not identical with  
lowercase English kay k
- ο = lowercase Greek omicron  
= lowercase English oh
- terminal lowercase Greek sigma ζ  
is similar to  
but not identical with  
lowercase English ess s
- lowercase Greek chi χ  
is similar to  
but not identical with  
lowercase English ex x

□ some one-word section headings may be conveniently abbreviated by the capitalized initial letter followed by a period  
eg

- Axiom. = A.
- Comment. = C.
- Corollary. = K. (phonetic value)
- Definition. = D.
- Example. = E.
- Lemma. = L.
- Note. = N.
- Proof. = P.
- Question. = Q.
- Remark. = R.
- Theorem. = T.

□ to say that a letter notation comes from the initial letter of a certain word may be fully & historically correct only if the etymology of the word is considered as part of the word;  
here are two examples

- Euler was the first to use  $i$  as the imaginary unit whose square is  $-1$ ;  
that occurred in 1777;  
since he wrote in Latin,  
to Euler  $i$  would be  
the initial letter of the Latin word  
*imaginarius* = imaginary  
from which the English word 'imaginary'  
descends

- the notation  $\pi$  for the circle ratio  
was first used by  
William Jones  
1675-1749  
Welsh  
applied mathematician,  
mathematics teacher & expositor;  
that occurred in 1706;  
 $\pi$  is the initial letter of the Greek word  
*περιφέρω* = to carry around  
from which the English word 'periphery'  
descends
