□  $x, y, u, t \in \text{real nr var}$

□ the real gudermannian function

=<sub>ab</sub> the gudermannian

=<sub>pr</sub> goohd - er - MAHN - ee - en

=<sub>dn</sub>  $\text{gd } x \quad (-\infty < x < \infty)$

wh  $\text{gd} \leftarrow \underline{\text{gudermannian}}$

=<sub>rd</sub> goohd - er  $x$

=<sub>df</sub>  $\text{Tan}^{-1} \sinh x$

□ the real gudermannian  
constitutes a real bridge between  
the real trigonometric functions  
and  
the real hyperbolic functions

viz

$$y = \operatorname{gd} x$$

$\Rightarrow$

$$\sin y = \tanh x$$

$$\cos y = \operatorname{sech} x$$

$$\tan y = \sinh x$$

$$\cot y = \operatorname{csch} x$$

$$\sec y = \cosh x$$

$$\csc y = \operatorname{coth} x$$

&

$$\tan \frac{y}{2} = \tanh \frac{x}{2}$$

$$\cot \frac{y}{2} = \operatorname{coth} \frac{x}{2}$$

□ the correspondence between  
the trig fcns and the hyp fcns  
via the gudermannian  
produces a correspondence between  
trig identities and hyp identities;  
eg looking at  
the three trig pythagorean identities

trig:  $\sin^2 x + \cos^2 x = 1$

hyp:  $\tanh^2 x + \operatorname{sech}^2 x = 1$

trig:  $1 + \tan^2 x = \sec^2 x$

hyp:  $1 + \sinh^2 x = \cosh^2 x$

trig:  $1 + \cot^2 x = \operatorname{csc}^2 x$

hyp:  $1 + \operatorname{csc h}^2 x = \operatorname{coth}^2 x$

□ the correspondence  
between trig fcns & hyp fcns  
via the gudermannian  
has a geometric description  
which is given by the following  
three labeled right triangles

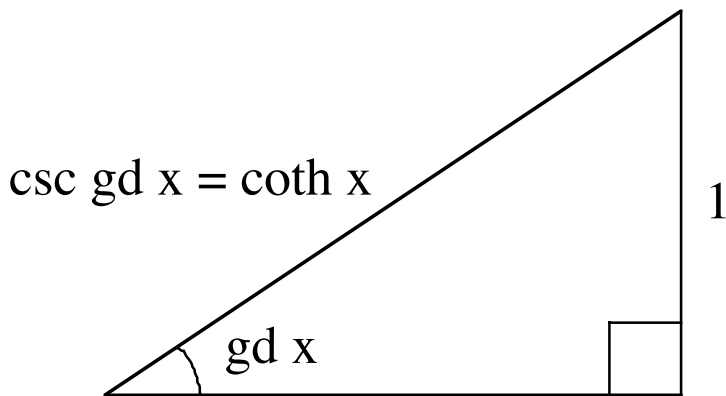

$$\sin \text{gd } x = \tanh x$$

$$\cos \text{gd } x = \text{coth } x$$

$$\sec \text{gd } x = \cosh x$$

$$\tan \text{gd } x = \sinh x$$

$$\csc \text{gd } x = \text{coth } x$$

$$\cot \text{gd } x = \text{csch } x$$

□ forms of the gudermannian

$$\operatorname{gd} x$$

$$= \sin^{-1} \tanh x$$

$$= \cos^{-1} \operatorname{sech} x$$

$$= \tan^{-1} \sinh x$$

$$= \cot^{-1} \operatorname{csc} h x$$

$$= \sec^{-1} \cosh x$$

$$= \operatorname{csc}^{-1} \operatorname{coth} x$$

$$= 2 \tan^{-1} \tanh \frac{x}{2}$$

$$= 2 \tan^{-1} e^x - \frac{\pi}{2}$$

$$= \int_0^x \operatorname{sech} t \, dt$$

(domains & ranges have to be specified)

GG88-8

□ forms of the inverse gudermannian

$$\begin{aligned} \operatorname{gd}^{-1} x &= \sinh^{-1} \tan x \\ &= \cosh^{-1} \sec x \\ &= \tanh^{-1} \sin x \\ &= \operatorname{coth}^{-1} \csc x \\ &= \operatorname{sech}^{-1} \cos x \\ &= \operatorname{csch}^{-1} \cot x \\ &= 2 \tanh^{-1} \tan \frac{x}{2} \\ &= \log \tan \left( \frac{x}{2} + \frac{\pi}{4} \right) \\ &= \log (\sec x + \tan x) \\ &= \int_0^x \sec t \, dt \end{aligned}$$

(domains & ranges have to be specified)

GG88-9

□ properties of the gudermannian  $y = \operatorname{gd} x$   
and its graph

△ the function  $y = \operatorname{gd} x$  has these properties

• domain:  $-\infty < x < \infty$

• range:  $-\frac{\pi}{2} < y < \frac{\pi}{2}$

• class: analytic

• parity: odd

• strictly increasing

•  $\operatorname{gd}(0) = 0$

•  $\operatorname{gd} x > 0 \Leftrightarrow x > 0$

•  $\operatorname{gd} x < 0 \Leftrightarrow x < 0$

•  $\exists \lim_{x \rightarrow \infty} \operatorname{gd} x = \frac{\pi}{2}$

•  $\exists \lim_{x \rightarrow -\infty} \operatorname{gd} x = -\frac{\pi}{2}$

△ the graph of  $y = \arctan x$  has these properties

- thru origin with slope 1
- symmetric wrt origin
- steadily rising
- asymptotic to horizontal line  $y = \frac{\pi}{2}$
- asymptotic to horizontal line  $y = -\frac{\pi}{2}$
- flex point at origin
- concave down for  $x > 0$
- concave up for  $x < 0$

- parametric equations, first form

$$\begin{cases} x = 2 \tanh^{-1} t \\ y = 2 \tan^{-1} t \end{cases}$$

wh  $|t| < 1$

- parametric equations, second form

$$\begin{cases} x = 2 \coth^{-1} t \\ y = 2 \cot^{-1} t \end{cases}$$

wh  $|t| > 1$

note: the values of the inv trig fcns

$\tan^{-1} t$  &  $\cot^{-1} t$

are to be properly chosen

□ do - it - yourself sketch:  
graph of the gudermannian  
 $y = \operatorname{gd} x \quad (-\infty < x < \infty)$

□ properties of the inverse gudermannian  $y = \operatorname{gd}^{-1} x$   
and its graph

△ the function  $y = \operatorname{gd}^{-1} x$  has these properties

- domain:  $-\frac{\pi}{2} < x < \frac{\pi}{2}$
- range:  $-\infty < y < \infty$
- class: analytic
- parity: odd
- strictly increasing
- $\operatorname{gd}^{-1}(0) = 0$
- $\operatorname{gd}^{-1} x > 0 \Leftrightarrow x > 0$
- $\operatorname{gd}^{-1} x < 0 \Leftrightarrow x < 0$
- $\operatorname{gd}^{-1} x \rightarrow \infty$  as  $x \uparrow \frac{\pi}{2}$
- $\operatorname{gd}^{-1} x \rightarrow -\infty$  as  $x \downarrow -\frac{\pi}{2}$

△ the graph of  $y = \text{gd}^{-1}x$  has these properties

- thru origin with slope 1
- symmetric wrt origin
- steadily rising
- asymptotic to vertical line  $x = \frac{\pi}{2}$
- asymptotic to vertical line  $x = -\frac{\pi}{2}$
- flex point at origin
- concave up for  $x > 0$
- concave down for  $x < 0$

- parametric equations, first form

$$\begin{cases} x = 2 \tan^{-1} t \\ y = 2 \tanh^{-1} t \end{cases}$$

wh  $|t| < 1$

- parametric equations, second form

$$\begin{cases} x = 2 \cot^{-1} t \\ y = 2 \coth^{-1} t \end{cases}$$

wh  $|t| > 1$

note: the values of the inv trig fcns

$\tan^{-1} t$  &  $\cot^{-1} t$

are to be properly chosen

□ do - it - yourself sketch:

graph of the inverse gudermannian

$$y = \operatorname{gd}^{-1}x \quad \left( -\frac{\pi}{2} < x < \frac{\pi}{2} \right)$$

□ derivatives and differentials

- $\frac{d}{dx} \operatorname{gd} x = \operatorname{sech} x$
- $\frac{d}{dx} \operatorname{gd}^{-1} x = \sec x$
- $d \operatorname{gd} x = \operatorname{sech} x dx$
- $d \operatorname{gd}^{-1} x = \sec x dx$

□ indefinite and definite integrals

$$\bullet \int \operatorname{sech} x \, dx = \operatorname{gd} x + C$$

$$\bullet \int \sec x \, dx = \operatorname{gd}^{-1} x + C$$

$$\bullet \int_0^x \operatorname{sech} t \, dt = \operatorname{gd} x$$

$$\bullet \int_0^x \sec t \, dt = \operatorname{gd}^{-1} x$$

□ the Maclaurin series for  $\operatorname{gd} x$

$\operatorname{gd} x$

$$= x - \frac{x^3}{6} + \frac{x^5}{24} - \frac{61x^7}{5040} + \dots$$

$$= \sum_{n=0}^{\infty} \frac{E_{2n}}{(2n+1)!} x^{2n+1}$$

IC:  $-1 < x < 1$

□ the Maclaurin series for  $\operatorname{gd}^{-1} x$

$$\begin{aligned} & \operatorname{gd}^{-1} x \\ &= x + \frac{x^3}{6} + \frac{x^5}{24} + \frac{61x^7}{5040} + \dots \end{aligned}$$

$$= \sum_{n=0}^{\infty} (-1)^n \frac{E_{2n}}{(2n+1)!} x^{2n+1}$$

$$\text{IC: } -\frac{\pi}{2} < x < \frac{\pi}{2}$$

□ more formulas

$$\bullet \tanh \frac{1}{2} x = \tan \frac{1}{2} \operatorname{gd} x \quad \& \quad \operatorname{coth} \frac{1}{2} x = \cot \frac{1}{2} \operatorname{gd} x$$

$$\bullet e^x$$

$$= \sec \operatorname{gd} x + \tan \operatorname{gd} x$$

$$= \frac{1 + \sin \operatorname{gd} x}{\cos \operatorname{gd} x}$$

$$= \frac{\cos \operatorname{gd} x}{1 - \sin \operatorname{gd} x}$$

$$= \tan \left( \frac{1}{2} \operatorname{gd} x + \frac{\pi}{4} \right)$$

$$\bullet \operatorname{gd}^{-1} \left( x + \frac{\pi}{2} \right) = \log (\csc x - \cot x)$$

$$\bullet \frac{d}{dx} \operatorname{gd}^{-1} \left( x + \frac{\pi}{2} \right) = \csc x$$

$$\bullet \int \csc x \, dx = \operatorname{gd}^{-1} \left( x + \frac{\pi}{2} \right) + C$$

□ the six basic trig functions  
may be rationalized  
by the substitution

$$u = \tan \frac{x}{2}$$

viz

$$\sin x = \frac{2u}{1+u^2} \qquad \cos x = \frac{1-u^2}{1+u^2}$$

$$\tan x = \frac{2u}{1-u^2} \qquad \cot x = \frac{1-u^2}{2u}$$

$$\sec x = \frac{1+u^2}{1-u^2} \qquad \csc x = \frac{1+u^2}{2u}$$

&

$$dx = \frac{2 du}{1+u^2}$$

so that some trig integrands  
may be rationalized by this substitution

- a geometric description of the substitution

$$u = \tan \frac{x}{2}$$

is given by the labeled right triangle

□ the six basic hyp functions  
may be rationalized  
by the substitution

$$u = \tanh \frac{x}{2}$$

viz

$$\sinh x = \frac{2u}{1-u^2} \qquad \cosh x = \frac{1+u^2}{1-u^2}$$

$$\tanh x = \frac{2u}{1+u^2} \qquad \coth x = \frac{1+u^2}{2u}$$

$$\operatorname{sech} x = \frac{1-u^2}{1+u^2} \qquad \operatorname{csch} x = \frac{1-u^2}{2u}$$

&

$$dx = \frac{2 du}{1-u^2}$$

so that some hyp integrands  
may be rationalized by this substitution

- a geometric description of the substitution

$$u = \tanh \frac{x}{2}$$

is given by the labeled right triangle

□ a definite integral

the area of

the region in QI bounded by

the curve  $y = g d x$

& the horizontal line  $y = \frac{\pi}{2}$

& the  $y$  – axis

=

the area of

the region in QI bounded by

the curve  $y = g d^{-1} x$

& the vertical line  $x = \frac{\pi}{2}$

& the  $x$  – axis

$$= \int_0^{\infty} \left( \frac{\pi}{2} - \operatorname{gd} x \right) dx$$

$$= \int_0^{\frac{\pi}{2}} \operatorname{gd}^{-1} x \, dx$$

$$= 2 \int_0^{\frac{\pi}{4}} \log \cot x \, dx$$

$$= 2\phi$$

$$\approx 1.83 +$$

wh

$\phi$

=<sub>cl</sub> Catalan's constant

$$=_{\text{df}} 1 - \frac{1}{3^2} + \frac{1}{5^2} - \frac{1}{7^2} + \dots$$

$$= \sum_{n=0}^{\infty} (-1)^n \frac{1}{(2n+1)^2}$$

$$= 0.91596\ 55941\ 77219\ 01505\ 46035 +$$

□ further uses of the Gudermannian  
pop up in various places such as  
the theory of elliptic functions,  
noneuclidean geometry,  
physics of the pendulum,  
and cartography;  
indeed in the Mercator map projection  
the vertical distance from the equator  
of a location on the chart  
is given by  $gd^{-1} \vartheta$   
where  $\vartheta$  is the latitude of the location

□ bioline

Christoph Gudermann

1798 - 1852

German

analyst, geometer; teacher of Weierstrass;

name 'gudermannian' and notation 'gd'

in present usage were introduced by Cayley

in honor of Gudermann's work in the area

□ IMHO

the gudermannian should appear  
in several exercises scattered thruout  
the undergraduate calculus courses;  
for example, it helps to clarify that mysterious formula  
for the indefinite integral of the secant  
and indeed provides a short formula for it;  
likewise for the cosecant;  
it correlates the trig functions  
and the hyperbolic functions  
in a pleasant and surprising manner
