$\square$ unified product rule for derivatives
$\Delta$ to differentiate a product, differentiate each factor separately \& add
$\Delta$ applications

- product of any number of real/complex functions
- scalar product of two vectors
- vector product of two 3 -vectors
- triple scalar product of three 3 -vectors
- triple vector product of three 3 -vectors
- multiple vector products of 3 -vectors
- determinant of any order (op on rows or cols)
- etc
$\Delta$ the uniformity of this product rule comes from the multilinearity of these products
T. let
$\mathrm{f} \in$ real - valued function on a real interval
then
$\mathrm{f} \in$ differentiable
$\Downarrow$
$\mathrm{f} \in$ continuous
$\Downarrow$
$\mathrm{f} \in$ integrable
\&
all converses fail

GG45-4

## D. a Leibniz series

$=_{\mathrm{df}}$ an alternating series
$a_{0}-a_{1}+a_{2}-a_{3}+\cdots$
of positive real numbers
$a_{0}, a_{1}, a_{2}, a_{3}, \cdots$
st
$\mathrm{a}_{\mathrm{n}} \geq \mathrm{a}_{\mathrm{n}+1} \quad(\mathrm{n} \in$ nonneg int var)
\&
$\mathrm{a}_{\mathrm{n}} \rightarrow 0$ as $\mathrm{n} \rightarrow \infty$
T. every Leibniz series converges
T. the harmonic series diverges
P. otherwise

S
$=1+\frac{1}{2}+\frac{1}{3}+\frac{1}{4}+\frac{1}{5}+\frac{1}{6}+\cdots$
$=\left(1+\frac{1}{2}\right)+\left(\frac{1}{3}+\frac{1}{4}\right)+\left(\frac{1}{5}+\frac{1}{6}\right)+\cdots$
$>\left(\frac{1}{2}+\frac{1}{2}\right)+\left(\frac{1}{4}+\frac{1}{4}\right)+\left(\frac{1}{6}+\frac{1}{6}\right)+\cdots$
$=1+\frac{1}{2}+\frac{1}{3}+\cdots$
$=\mathrm{s}$
\& $\mathrm{s}>\mathrm{s}$
$\therefore$ the harmonic series diverges QED

## $\square$ an interesting inequality

T. $\sum_{\mathrm{k}=1}^{\mathrm{n}} \frac{1}{\sqrt{\mathrm{k}}}>\sqrt{\mathrm{n}} \quad(\mathrm{n} \in \operatorname{int} \geq 2)$
P. note that
$\frac{1}{\sqrt{\mathrm{k}}}>\sqrt{\mathrm{k}}-\sqrt{\mathrm{k}-1}$ for $\mathrm{k} \geq 2$
\&
a telescoping sum results from substitution QED
$\square$ a theorem
whose proof from the analytic POV
is not immediate but which is evident from the geometric POV
T. let

- $\mathrm{a}, \mathrm{b} \in$ real nos st $\mathrm{a}<\mathrm{b}$
- $\mathrm{y}=\mathrm{y}(\mathrm{x}), 0 \leq \mathrm{x} \leq \mathrm{a}$ \&
$\mathrm{x}=\mathrm{x}(\mathrm{y}), 0 \leq \mathrm{y} \leq \mathrm{b}$
$\in$ inverse strictly increasing continuous real functions
then
- $\int_{0}^{a} y d x+\int_{0}^{b} x d y=a b$
T. the fundamental theorem for space curves let
- $\mathrm{s}=$ arclength
- $\kappa=$ curvature
- $\tau=$ torsion
- $\kappa=\kappa(s) \geq 0$ \& $\tau=\tau(s)$
$\in$ given continuous real - valued functions on a real interval
then
- there exists a class $\mathrm{C}^{2}$ space curve, unique up to rigid motion, with the given curvature $\kappa=\kappa(s)$ \&
with the given torsion $\tau=\tau$ (s)

GG45-9

# $\square$ four forms of the Dirichlet 

 box / drawer / pigeonhole principle(1) if $n+1$ objects are placed in $n$ boxes where n is a positive integer, then at least one box contains at least two objects
(2) if X and Y are sets of any cardinality such that $\operatorname{crd} \mathrm{X}>\operatorname{crd} \mathrm{Y}$, and if $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$, then there exists $y \in Y$ such that $\operatorname{crdf}^{-1}(y)>1$
(3) if infinitely many objects are placed in finitely many boxes, then at least one box contains infinitely many objects
(4) if X is an infinite set, if Y is a finite set, and if $\mathrm{f}: \mathrm{X} \rightarrow \mathrm{Y}$, then there exists $y \in Y$ such that $f^{-1}(y)$ is an infinite set
(2) is a set - theoretic generalization of (1);
(4) is a set - theoretic equivalent of (3)

GG45-10

Question.
Is the following statement mathematically true?
If there are more trees in the world than there are leaves on any one tree, then there are at least two trees
with the same number of leaves.
Answer. Not as it stands.
It is true under three additional conditions, namely: there are only finitely many trees in the world, there is at least one tree in the world, every tree has at least one leaf.

## $\square$ Lagrange' s identity for vectors

## T. Lagrange' s identity for two 2 - vectors

 let$\mathbf{a}, \mathbf{b} \in 2$ - vectors over a com ring
then
$\left|\mathbf{a}, \mathbf{b}^{2}=\right| \begin{array}{ll}\mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} \\ \mathbf{b} \cdot \mathbf{a} & \mathbf{b} \cdot \mathbf{b}\end{array}$

GG45-12
T. Lagrange' s identity for two 3 - vectors let
$\mathbf{a}, \mathbf{b} \in 3$ - vectors over a com ring
then
$(\mathbf{a} \times \mathbf{b})^{2}=\left|\begin{array}{cc}\mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} \\ \mathbf{b} \cdot \mathbf{a} & \mathbf{b} \cdot \mathbf{b}\end{array}\right|$

## T. Lagrange's identity for two vectors

let
$\mathbf{a}, \mathbf{b} \in \mathrm{n}-$ vectors over a com ring ( $\mathrm{n} \in \operatorname{pos}$ int)
then

- in scalar notation
$\sum_{\substack{i, j=1 \\ i<j}}^{n}\left|\begin{array}{ll}a_{i} & a_{j} \\ b_{i} & b_{j}\end{array}\right|^{2}=\left|\begin{array}{ll}\sum_{i=1}^{n} a_{i}^{2} & \sum_{i=1}^{n} a_{i} b_{i} \\ \sum_{i=1}^{n} a_{i} b_{i} & \sum_{i=1}^{n} b_{i}^{2}\end{array}\right|$
- in vector notation
$\frac{1}{2}(\mathbf{a b}-\mathbf{b a})^{2}=\left|\begin{array}{ll}\mathbf{a} \cdot \mathbf{a} & \mathbf{a} \cdot \mathbf{b} \\ \mathbf{b} \cdot \mathbf{a} & \mathbf{b} \cdot \mathbf{b}\end{array}\right|$

GG45-14
T. Lagrange' s identity for four 2 - vectors let
$\mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{d} \in 2$ - vectors over a com ring
then
$|\mathbf{a}, \mathbf{b}| \cdot|\mathbf{c}, \mathbf{d}|=\left|\begin{array}{ll}\mathbf{a} \cdot \mathbf{c} & \mathbf{a} \cdot \mathbf{d} \\ \mathbf{b} \cdot \mathbf{c} & \mathbf{b} \cdot \mathbf{d}\end{array}\right|$

GG45-15

# T. Lagrange' s identity for four 3-vectors let 

$\mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{d} \in 3-$ vectors over a com ring
then
$(\mathbf{a} \times \mathbf{b}) \cdot(\mathbf{c} \times \mathbf{d})=\left|\begin{array}{ll}\mathbf{a} \cdot \mathbf{c} & \mathbf{a} \cdot \mathbf{d} \\ \mathbf{b} \cdot \mathbf{c} & \mathbf{b} \cdot \mathbf{d}\end{array}\right|$
T. Lagrange's identity for four vectors let
$\mathbf{a}, \mathbf{b}, \mathbf{c}, \mathbf{d} \in \mathrm{n}-$ vectors over a com ring ( $\mathrm{n} \in \operatorname{pos}$ int) then

- in scalar notation
$\sum_{\substack{i, j=1 \\ i<j}}^{n}\left|\begin{array}{ll}a_{i} & a_{j} \\ b_{i} & b_{j}\end{array}\right| \cdot\left|\begin{array}{cc}c_{i} & c_{j} \\ d_{i} & d_{j}\end{array}\right|=\left|\begin{array}{ll}\sum_{i=1}^{n} a_{i} c_{i} & \sum_{i=1}^{n} a_{i} d_{i} \\ \sum_{i=1}^{n} b_{i} c_{i} & \sum_{i=1}^{n} b_{i} d_{i}\end{array}\right|$
- in vector notation

$$
(\mathbf{a b}-\mathbf{b a}) \cdot(\mathbf{c d}-\mathbf{d c})=2\left|\begin{array}{ll}
\mathbf{a} \cdot \mathbf{c} & \mathbf{a} \cdot \mathbf{d} \\
\mathbf{b} \cdot \mathbf{c} & \mathbf{b} \cdot \mathbf{d}
\end{array}\right|
$$

## T. Cauchy - Riemann equations <br> = CRE

let

- $x, y, u, v \in$ real var
- $\mathrm{z}, \mathrm{w} \in$ complex var
- $x+i y=z$
- $u+i v=w$
- $\mathrm{w}=\mathrm{w}(\mathrm{z})$
- $\exists \frac{\mathrm{dw}}{\mathrm{dz}}$
then

$$
\left\{\begin{array}{l}
\mathrm{u}_{\mathrm{x}}=\mathrm{v}_{\mathrm{y}} \\
\mathrm{u}_{\mathrm{y}}=-\mathrm{v}_{\mathrm{x}}
\end{array}\right.
$$

P. in three parts
(1) $\frac{d w}{d z}$
$=\frac{\partial w}{\partial x}$
$=\frac{\partial}{\partial x}(u+i v)$
$=\mathrm{u}_{\mathrm{x}}+\mathrm{iv} \mathrm{x}_{\mathrm{x}}$
(2) $\frac{d w}{d z}$
$=\frac{\partial w}{\partial(i y)}$
$=\frac{\partial}{\partial(i y)}(u+i v)$
$=\frac{1}{i} \frac{\partial}{\partial y}(u+i v)$
$=\frac{1}{\mathrm{i}}\left(\mathrm{u}_{\mathrm{y}}+\mathrm{iv} \mathrm{v}_{\mathrm{y}}\right)$
$=\mathrm{v}_{\mathrm{y}}-\mathrm{i} \mathrm{u}_{\mathrm{y}}$
(3) $u_{x}+i v_{x}$
$=\frac{\mathrm{d} \mathrm{w}}{\mathrm{dz}}$
$=\mathrm{v}_{\mathrm{y}}-\mathrm{i} \mathrm{u}_{\mathrm{y}}$
$\therefore \mathrm{u}_{\mathrm{x}}=\mathrm{v}_{\mathrm{y}} \& \mathrm{u}_{\mathrm{y}}=-\mathrm{v}_{\mathrm{x}}$ qed
K. the Jacobian of ( $u, v$ ) wrt ( $x, y$ )
$=\operatorname{det} \frac{\partial(u, v)}{\partial(x, y)}$
$=\left|\begin{array}{ll}u_{x} & u_{y} \\ v_{x} & v_{y}\end{array}\right|$
$=u_{x} v_{y}-u_{y} v_{x}$
$=u_{x}^{2}+v_{x}^{2}$
$=u_{y}{ }^{2}+v_{y}^{2}$
$=\mathrm{u}_{\mathrm{x}}{ }^{2}+\mathrm{u}_{\mathrm{y}}{ }^{2}$
$=\mathrm{v}_{\mathrm{x}}{ }^{2}+\mathrm{v}_{\mathrm{y}}{ }^{2}$
$=\left|\frac{\mathrm{dw}}{\mathrm{dz}}\right|^{2}$
$\geq 0$
$\square$ the law of inclusion - exclusion for finite sets
$\Delta$ law of inclusion-exclusion for two finite sets A,B

- $\operatorname{crd}(\mathrm{A} \cup \mathrm{B})=\operatorname{crd} \mathrm{A}+\operatorname{crd} \mathrm{B}-\operatorname{crd}(\mathrm{A} \cap \mathrm{B})$
$\Delta$ law of inclusion- exclusion for three finite sets A, B, C
- $\operatorname{crd}(\mathrm{A} \cup \mathrm{B} \cup \mathrm{C})$
$=\operatorname{crd} \mathrm{A}+\operatorname{crd} \mathrm{B}+\operatorname{crdC}$
$-\operatorname{crd}(\mathrm{A} \cap \mathrm{B})-\operatorname{crd}(\mathrm{A} \cap \mathrm{C})-\operatorname{crd}(\mathrm{B} \cap \mathrm{C})$
$+\operatorname{crd}(\mathrm{A} \cap \mathrm{B} \cap \mathrm{C})$
$\Delta$ law of inclusion - exclusion for n finite sets $\mathrm{A}_{1}, \mathrm{~A}_{2}, \cdots, \mathrm{~A}_{\mathrm{n}} \quad(\mathrm{n} \in$ pos int)
- $\operatorname{crd} \bigcup_{i=1}^{n} A_{i}$
$=\sum_{\mathrm{i}=1}^{\mathrm{n}} \operatorname{crd} \mathrm{A}_{\mathrm{i}}$

$+(-1)^{\mathrm{n}+1} \operatorname{crd}\left(\mathrm{~A}_{1} \mathrm{~A}_{2} \cdots \mathrm{~A}_{\mathrm{n}}\right)$

GG45-23
$\square$ the general law of inclusion-exclusion not only holds for finite cardinality but also holds for the measure of finitely many sets of finite measure in a finitely additive measure space and also holds for the indicator applied to finitely many sets (these sets finite or not); the cases of $2 \& 3$ sets
are given below

GG45-24
$\square$ the law of inclusion-exclusion for the measure of two sets A, B
\& of three sets A, B, C, all of finite measure in a finitely additive measure space

- $\mathrm{m}(\mathrm{A} \cup \mathrm{B})=\mathrm{mA}+\mathrm{mB}-\mathrm{m}(\mathrm{A} \cap \mathrm{B})$
- $m(A \cup B \cup C)$
$=m A+m B+m C$
$-m(A \cap B)-m(A \cap C)-m(B \cap C)$
$+\mathrm{m}(\mathrm{A} \cap \mathrm{B} \cap \mathrm{C})$
$\square$ the law of inclusion - exclusion for the indicator applied to two sets A, B \& applied to three sets A, B, C
- $\mathrm{I}(\mathrm{x}, \mathrm{A} \cup \mathrm{B})=\mathrm{I}(\mathrm{x}, \mathrm{A})+\mathrm{I}(\mathrm{x}, \mathrm{B})-\mathrm{I}(\mathrm{x}, \mathrm{A} \cap \mathrm{B})$
- $\mathrm{I}(\mathrm{x}, \mathrm{A} \cup \mathrm{B} \cup \mathrm{C})$
$=\mathrm{I}(\mathrm{x}, \mathrm{A})+\mathrm{I}(\mathrm{x}, \mathrm{B})+\mathrm{I}(\mathrm{x}, \mathrm{C})$
$-I(x, A \cap B)-I(x, A \cap C)-I(x, B \cap C)$
$+\mathrm{I}(\mathrm{x}, \mathrm{A} \cap \mathrm{B} \cap \mathrm{C})$

## $\square$ relative strengths

 of the inclusion-exclusion lawsthe law for the indicator implies
the law for measure implies
the law for cardinality

GG45-27
$\square$ the Heisenberg indeterminacy / uncertainty principle applies to a particle

$$
\begin{aligned}
& \Delta \mathrm{q} \Delta \mathrm{p} \geq \mathrm{h} / 2 \pi \\
& \& \\
& \Delta \mathrm{t} \Delta \mathrm{E} \geq \mathrm{h} / 2 \pi \\
& \text { wh } \\
& \Delta=\text { error in measurement of } \\
& \mathrm{q}=\text { position coordinate } \\
& \mathrm{p}=\text { momentum } \\
& \mathrm{t}=\text { time } \\
& \mathrm{E}=\text { energy } \\
& \mathrm{h}=\text { Planck's constant }
\end{aligned}
$$
