GG68-2
$\square$ symmetric functions
are here presented
in a formal syntactic way
ito variables \& polynomials \& expressions
rather than in an equivalent logically precise way using inp the notion of function as set; the justification of this classical approach is that it is clear
how the set-theoretic description proceeds and
that the syntactic language is
more picturesque \& colorful
\& often easier to use \& understand;
the syntactic language
may help in making the formulas/functions more vivid \& visual \& visualizable \& tactile

Standing Notation.

- for the sake of simpler hypotheses in an initial exposition of symmetric functions, let the field of complex numbers be the algebraic base structure;
all considerations will be relative to the complex number field;
it will be clear afterward (more or less)
what algebraic structures will support what algebraic notions and what algebraic arguments
- let $\mathrm{n} \in$ positive integer
- let $\mathrm{x}_{1}, \mathrm{x}_{2}, \cdots, \mathrm{x}_{\mathrm{n}}$ be n independent complex variables
- other notation: for any positive integer $m$ the m - file $\underline{\mathrm{m}}=_{\mathrm{df}}\{1,2,3, \cdots, \mathrm{~m}\}$ the $\mathrm{m}-\operatorname{seg} \hat{\mathrm{m}}=_{\mathrm{df}}\{0,1,2,3, \cdots, m\}$ wh seg $\leftarrow$ segment

GG68-4
D. the $n+1$ elementary symmetric functions of n variables
let
$\cdot \mathrm{k} \in \hat{\mathrm{n}}=\{0,1,2, \cdots, \mathrm{n}\}$
then

- the elementary symmetric function of degree k for / in / of / on $\mathrm{x}_{1}, \mathrm{x}_{2}, \cdots, \mathrm{x}_{\mathrm{n}}$
$=$ the kth elementary symmetric function
for / in / of / on $x_{1}, x_{2}, \cdots, x_{n}$
$={ }_{\mathrm{dn}} \sigma_{\mathrm{k}}\left(\mathrm{x}_{1}, \mathrm{x}_{2}, \cdots, \mathrm{x}_{\mathrm{n}}\right)$
$={ }_{r d} \operatorname{sig}(m a)(s u b) k$ of $x_{1}, x_{2}, \cdots, x_{n}$
$={ }_{\mathrm{ab}} \sigma_{\mathrm{k}}$
$={ }_{\mathrm{rd}} \operatorname{sig}(\mathrm{ma})(\mathrm{sub}) \mathrm{k}$
$=_{\mathrm{df}}$ the polynomial of degree k in $\mathrm{x}_{1}, \mathrm{x}_{2}, \cdots, \mathrm{x}_{\mathrm{n}}$
which is the sum of all $\binom{n}{k}$ products
of $\mathrm{x}_{1}, \mathrm{x}_{2}, \cdots, \mathrm{x}_{\mathrm{n}}$ taken k at a time

## $\square$ examples

- $\mathrm{n}=1$
$\sigma_{0}=1$
$\sigma_{1}=\mathrm{x}_{1}$
- $\mathrm{n}=2$
$\sigma_{0}=1$
$\sigma_{1}=\mathrm{x}_{1}+\mathrm{x}_{2}$
$\sigma_{2}=\mathrm{x}_{1} \mathrm{X}_{2}$
- $\mathrm{n}=3$
$\sigma_{0}=1$
$\sigma_{1}=\mathrm{x}_{1}+\mathrm{x}_{2}+\mathrm{x}_{3}$
$\sigma_{2}=x_{1} x_{2}+x_{1} x_{3}+x_{2} x_{3}$
$\sigma_{3}=\mathrm{x}_{1} \mathrm{x}_{2} \mathrm{x}_{3}$
- $\mathrm{n}=4$
$\sigma_{0}=1$
$\sigma_{1}=\mathrm{x}_{1}+\mathrm{x}_{2}+\mathrm{x}_{3}+\mathrm{x}_{4}$
$\sigma_{2}=x_{1} x_{2}+x_{1} x_{3}+x_{1} x_{4}+x_{2} x_{3}+x_{2} x_{4}+x_{3} x_{4}$
$\sigma_{3}=\mathrm{x}_{1} \mathrm{x}_{2} \mathrm{x}_{3}+\mathrm{x}_{1} \mathrm{x}_{2} \mathrm{x}_{4}+\mathrm{x}_{1} \mathrm{x}_{3} \mathrm{x}_{4}+\mathrm{x}_{2} \mathrm{x}_{3} \mathrm{x}_{4}$
$\sigma_{4}=\mathrm{x}_{1} \mathrm{X}_{2} \mathrm{X}_{3} \mathrm{X}_{4}$
$\square$ in the expression for an elementary symmetric function the canonical order
of the variables in a term
and
of the terms themselves
is taken to be
the lexicographic order of variables/terms
as is illustrated above
or, what amounts to the same thing here, the numerical order of the subscripts
$\square$ the lowercase Greek letter sigma $\sigma$ with subscripts
may have been chosen
to denote the elementary symmetric functions
because
$s$ is the initial letter of both
the word 'symmetric' \& the word 'sum',
the elementary symmetric functions being
certain kinds of sums,
and because
the Latin/English letter ess S s
is the phonetic equivalent and the transliteration of
the Greek letter sigma $\Sigma \sigma$;
as a further notational comment
the subscript on sigma
matches
the number of factors
in each term of the polynomial

GG68-7
$\square$ the elementary symmetric functions are polynomials
\& are also called elementary symmetric polynomials; but in usage the word 'function' may nudge out the word 'polynomial' here on the grounds of history and also
on the grounds of brevity because 'function'
has 2 syllables and 8 letters
whereas 'polynomial' has
5 syllables and 10 letters

GG68-8

$\square$ every polynomial in symmetric functions
is clearly again a symmetric function;
the elementary symmetric functions
are all symmetric functions;
so every polynomial in the elementary symmetric functions is again a symmetric polynomial; the following theorem states that the converse also holds; thus the class of elementary symmetic functons is a particularly important class of symmetric functions
T. the fundamental theorem on symmetric polynomials: every symmetric polynomial of n variables over the complex field is uniquely expressible as
a polynomial in the elementary symmetric functions of these n variables over the complex field

note: think of
the formulas for the $s_{k}$ ito the $\sigma$ ' $s$
as $n$ takes on various values;
no matter what the value of n is,
the formula for $\mathrm{s}_{0}$ is
$\mathrm{s}_{0}=\mathrm{n} \sigma_{0} ;$
no matter what the value of $n$ is
the formula for $s_{1}$ is
$\mathrm{s}_{1}=\sigma_{1} ;$
thinking of the value of $k \geq 2$ as fixed
and
thinking of the value of n as increasing from 1
in unit incremental steps,
the formula for $\mathrm{s}_{\mathrm{k}}$
adds on terms until n attains k
and then afterward stays the same;
defining $\sigma_{\mathrm{k}}=0$ for $\mathrm{k} \in \operatorname{int} \& \mathrm{k}>\mathrm{n}$, the formulas for $\mathrm{s}_{\mathrm{k}}$ with larger n
collapse to
the formulas for $\mathrm{s}_{\mathrm{k}}$ with smaller n
if they change at all
$\square$ to see a pattern in the formulas for the s's ito the $\sigma$ 's, look at the determinant forms

$$
\mathrm{s}_{2}=\left|\begin{array}{cc}
\sigma_{1} & -1 \\
-2 \sigma_{2} & \sigma_{1}
\end{array}\right|

$\mathrm{s}_{4}=\left|\begin{array}{cccc}\sigma_{1} & -1 & 0 & 0 \\ -2 \sigma_{2} & \sigma_{1} & -1 & 0 \\ 3 \sigma_{3} & -\sigma_{2} & \sigma_{1} & -1 \\ -4 \sigma_{4} & \sigma_{3} & -\sigma_{2} & \sigma_{1}\end{array}\right|$
a general determinant can be written down for the s s ito the $\sigma^{\prime} \mathrm{s}$
but the alternation in signs
makes the notation rather unwieldly,
likely occupying a whole page
for the sake of attempted clarity;
later when the a's are defined simply ito the $\sigma^{\prime} \mathrm{s}$, a general determinant for the s ' s ito the a ' s
which is easier on the eyes
and more readily comprehensible
is written down

GG68-27
$\square$ just like the elementary symmetric functions, the power - sum symmetric functions
are also capable of expressing any symmetric polynomial as a polynomial in these functions, as witness the following theorem

$\square$ Newton's identities relate the $\sigma$ 's \& the a's on the one hand with
the s's on the other;
thus there are two forms of Newton's identities;
one form consists of $\sigma^{\prime} \mathrm{s} \& \mathrm{~s}^{\prime} \mathrm{s}$ together and
the other form consists a's \& s' s together;
each form is a sequence of formulas
depending on a pos int var k;
each form is expressed by two equations
because there is a change
in the structure of the first equation that affects the last term
when the parameter $k \in$ pos int var changes in possible value from weakly less than $n$ to weakly greater than n ;

GG68-48
the situation of two equations for each form
is brought about
at least partly because
there are only finitely many $\sigma$ ' $\& a^{\prime} s$
but there are infinitely many s's;
the two forms are thoroughly equivalent
since they are only slight notational variants of each other;
because the second form does not contain
the powers of -1 and the minus signs
that the first form contains,
the second form is
more compact and neater in appearance

GG68-49
$\square$ the first equation of the second form of Newton's identities is expressible as a matrix equation as follows:

$$
